Did there appear to be a dump? I am asking Weston if they remember anything. It is strange to me that we would not have addressed it as we did a lot of cleaning and pressure washing in that area.

I would say anywhere you have soil near the tanks could have some hydrocarbon contamination including the fill used to cover up the holes in secondary containment.

Gary

Thanks  
Gary

The attached photo shows the location of the sand that is covering some hydrocarbon impacts. We are going to handle this but we would like to address all areas (if there are any more) that have similar problems. If you have any information, I'd appreciate it so we can scope the work appropriately. I will follow-up with Terry Andrews and see if TCEQ has information about other locations that we should be aware of.

We are making use of the waste data you generated during the removal action to help with the waste unit closures. The waste in several tanks was nonhazardous so those units should not need to be closed as RCRA waste units.

We also have a question about the green frac tank left on the Site (see photo). You said this was owned by CES. The other three tanks (FT-1001, FT-1002, and FT-1004) were waste units listed on the TCEQ Notice of Registration. But we can't match up the green tank, FT-5180, with any of the waste units. The data show it had oily water. Did you have any other information or was this just one of the multitude of frac tanks?

Thanks for your help.

Brenda
